transforming medicine, improving lives

## Active Life Expectancy and Functional Limitations among Older Singaporeans: Gender, Educational and Ethnic Differences

Chi-Tsun Chiu ${ }^{1}$, Angelique Chan ${ }^{1}$, Victoria Haldane ${ }^{1}$, David Matchar ${ }^{1,2}$, Yasuhiko Saito ${ }^{1,3}$
${ }^{1}$ Duke-National University of Singapore, ${ }^{2}$ Duke University School of Medicine, ${ }^{3}$ Nihon University

## Introduction

- Singapore
- Experiencing the rapid population aging
- Proportion over 65 years old will increase from 9\% (2010) to 19\% in 2030.
- Changing demographic landscape:
- Increases in longevity
- Declining fertility rates
- Rising non-marriage rates
- Rising divorce rates
- Migration

Figure 1: Percentage of Population aged 65+

http://esa.un.org/unpd/wpp/index.htm

Figure 2:Percentage of Population aged 80+

Source: Population Division of the Department of Economic and Social Affairs of the United Nation Secretariat, World Population Prospects: The 2010 Revision,
http://esa.un.org/unpd/wpp/index.htm

## Implications of Demographic Trends

$>$ Fewer family members available to support older adults
$>$ Sandwich generation caring for children below 12 and members aged 65+ simultaneously
$>$ Longer period of caregiving $\rightarrow$ increased financial and emotional burden

## Recently Increased Dialogue On:

- Burden of chronic disease
- Caregiving
- Long term care
- Role of family versus the State in providing care
- Sustainable health system

# Policy Priorities for Older Persons in Singapore 

- Maximize family care
- Promote aging in place
- Strengthen community based health care services
- Minimize hospitalizations and institutionalization
- Improve provision and quality of LTC services

## NEED FOR EVIDENCE-BASED POLICY FORMULATION

transforming medicine, improving lives

## Active Life Expectancy and Functional Limitations among Older Singaporeans: Gender, Educational and Ethnic Differences

${ }^{1}$ Duke-National University of Singapore, ${ }^{2}$ Duke University School of Medicine, ${ }^{3}$ Nihon University

## Aims

- To examine health differences for older Singaporean by sex, education and ethnicity using the incidence-based multistate life tables (SPACE program).

## Theory background

- Sex
- females live longer but have more functional limitations and shorter ALE than their male COUnterperts (Crimmins et al. 1996; Geronimus et al. 2001; Kaneda et al. 2004; Keeler et al. 2010 ; Konno et al. 2004; Zimmer and House 2003).
- women continued to experience more functional limitations with increasing age, with little change when adjusted for explanatory factors peead ans sommenzone
- women were more likely to be functionally limited than men. roseatal 2001

## Theory background

- Education
- education creates a foundation for the factors that ultimately determine socioeconomic status and impact upon health frosese momesy, 1999)
- lower levels of education correlate to less years

## Theory background

- Ethnicity
- Cultural difference have been shown to affect health outcomes in Western countries
- Singapore's multi-ethnic composition makes it an excellent test ground for teasing out the effects of SES and culture on ethnic disparities in health.

## Data

- A nationally representative longitudinal data
- Aged 60+, N=4,990 (2009)
- Wave 2 (2011)
- Analysis sample: $\mathrm{N}=3,142$

## Measures

- Death data
- linked to a registry system from Singapore Ministry of Health
- follow-up interviews (from family members)
- Functional limitations
- Self-reported difficulty in performing at least one of 9 NAGI items.
- Inactive: Have difficulty performing any one of the 9 items
- Active: Have no difficulty performing all 9 items

## Measures

- Sex
- Education was considered a SES indicator.
- High: at least secondary education
- Low: no formal education or only primary education
- Ethnicity
- Chinese
- non-Chinese (including Malay, Indian, others)

## Method

- Transition probability
- Multinomial logistic regressions
- In(pij/pii)= $\beta 0 \mathrm{ij}+\beta 1 \mathrm{ij}$ *Age+ $\beta 2 \mathrm{ij}{ }^{*}$ Sex
- In(pij/pii)= $\beta 0 i \mathrm{ij}+\beta 1 \mathrm{ij}{ }^{*}$ Age $+\beta 2 \mathrm{ij}^{*}$ Education
- In $(\mathrm{pij} / \mathrm{pii})=\beta 0 \mathrm{ij}+\beta 1 \mathrm{ij}{ }^{*}$ Age $+\beta 2 \mathrm{ij}{ }^{*}$ Ethnicity

## Method

- Multistate life table (MSLT)
- The SPACE program was used to estimate MSLT functions and their sampling variability.
- Simulation cohort $\mathrm{N}=100,000$
- Bootstrap N=300
- An advantage of using the SPACE program is that standard errors can be estimated and the distribution of MSLT functions can be investigated. (see Cai et al. 2010 in Demographic Research for details)

SPACE: Stochastic Population Analysis for Complex Events

# DUKE <br> GRADUATE MEDICAL SCHOOL SINGAPORE 

## RESULTS

## Population-based estimates at age 60

|  |  | TLE | ALE | IALE | \%(ALE/TLE) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sex | Males | $2$ | $16.2$ | $\frac{5.2}{(4.32,6.09)^{*}}$ | 75.0\% |
|  | Females | $\begin{array}{\|c} \sqrt{25.6} \\ (24.07,27.09) \end{array}$ | $\sqrt{9.9}$ | $\underbrace{15.6}_{(14.24,17.03)}$ | 40.5\% |
| Education | Low | $\begin{gathered} 22.4 \\ (21.14,23.56)^{*} \end{gathered}$ | $\begin{gathered} 11.5 \\ (10.57,12.36)^{*} \end{gathered}$ | $\begin{gathered} 10.9 \\ (9.84,11.94) \end{gathered}$ | 52.0\% |
|  | High | $\begin{gathered} 27.9 \\ (24.94,30.96) \end{gathered}$ | $\begin{gathered} 16.9 \\ (15.05,18.68) \end{gathered}$ | $\begin{gathered} 11.1 \\ (8.55,13.62) \end{gathered}$ | 61.9\% |
| Ethnicity | Chinese | $\begin{gathered} 24.0 \\ (22.76,25.26) \end{gathered}$ | $\begin{gathered} 13.6 \\ (12.67,14.44)^{*} \end{gathered}$ | $\begin{gathered} 10.5 \\ (9.43,11.48) \end{gathered}$ | 57.1\% |
|  | non-Chinese | $\begin{gathered} 21.5 \\ (19.90,23.10) \end{gathered}$ | $\begin{gathered} 10.9 \\ (9.66,12.22) \end{gathered}$ | $\begin{gathered} 10.6 \\ (9.02,12.10) \end{gathered}$ | 53.1\% |

TLE: Total Life Expectancy; ALE: Active Life Expectancy; IALE: Inactive Life Expectancy * $\mathrm{p}<0.05$ comparing TLE, ALE or IALE between sex, education or ethnicity groups.

## Population-based estimates at age 60

|  |  | TLE | ALE | IALE | \%(ALE/TLE) |

|  | non-Chinese | $\begin{gathered} 21.3 \\ (19.66,22.84) \end{gathered}$ | $\begin{gathered} 8.4 \\ (7.06,9.78) \end{gathered}$ | $\begin{gathered} 12.8 \\ (11.20,14.47) \end{gathered}$ | 39.2\% |

## Summary

- Sex is associated with
- TLE, IALE ~ both are higher among Women
- ALE ~ it is higher among men
- Education is associated with
- TLE and ALE ~ both are higher among those with high education
- Higher educated have higher TLE due to higher ALE.
- Ethnicity is associated with ALE ~ Higher among the Chinese

## Our next steps: Two possible directions

- (1) Age-Friendly City
- Meaning
- Address the challenges of urban aging and best capitalize on the resources available in urban centers to promote active aging (wHo 2007)
- Active aging is "the process of optimizing opportunities for health, participation and security in order to enhance quality of life as people age" (wно 2007)
- Aim:
- To provide information base for "Age-Friendly City" in Singapore through better understanding health differences on functional limitations by sex, education or ethnicity

## Our next steps: Two possible directions

- (2) Including disability measures
- Four health states:
- Active, With functional limitation (but not disabled), Disabled, Death
- Estimating transitions probabilities and health expectancy
- Reason
- People who have difficulty performing any one of 9 NAGI items are almost disabled.
- To separate functional limitation and disability may help to clarify the health differences on health expectancies by sex, education, and ethnicity
