PROFESSOR DEREK A MANN

Fibrogenic-Inflammatory Cross-Talk in Post-Total Knee Arthroplasty - A Human Model of Induced Chronic Fibrosis

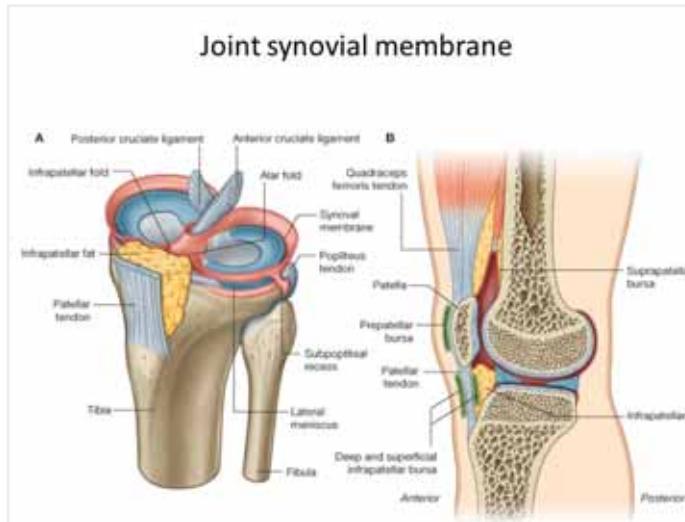

Total Knee Arthroplasty (TKA)

- TKA is a surgical procedure in which the diseased knee joint is replaced with an artificial joint.
- Osteoarthritis is the most common condition for which TKA is used therapeutically.
- 100,000 primary TKAs carried out in UK annually.
- 15-30% of patients express dissatisfaction with outcome.
- Pain, stiffness, ‘grinding’, swelling/tightness and impaired mobility are the most common complaints.

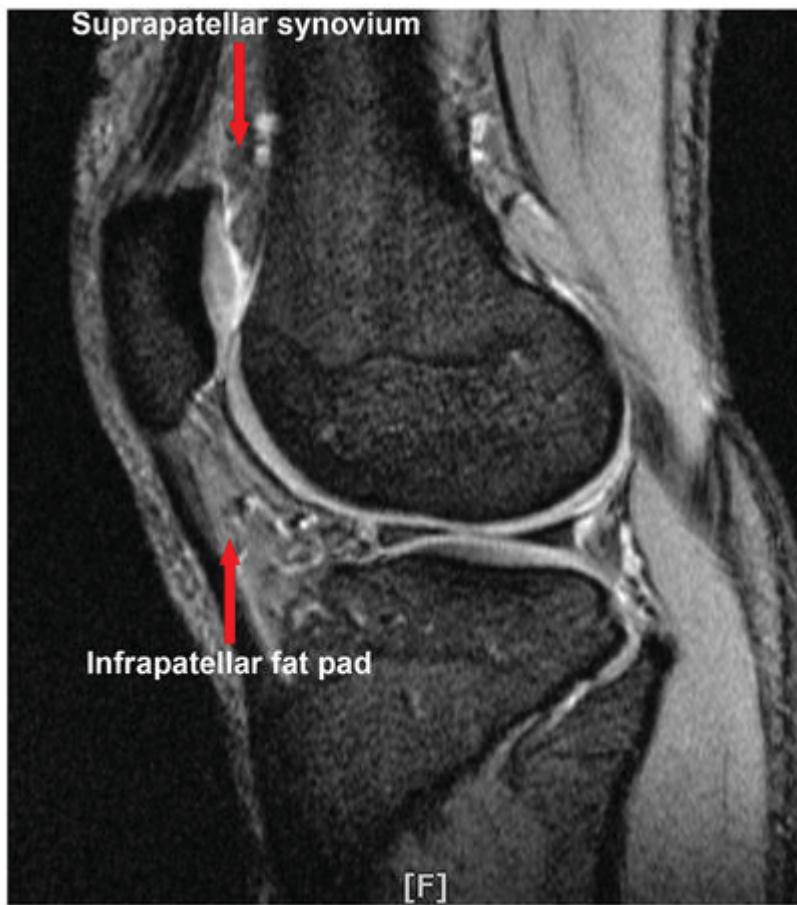

Athrofibrosis

- Up to 10% of TKA develop post-operative stiffness (athrofibrosis)
- Joint structures affected by athrofibrosis include the synovial membrane and infrapatellar fat pad.

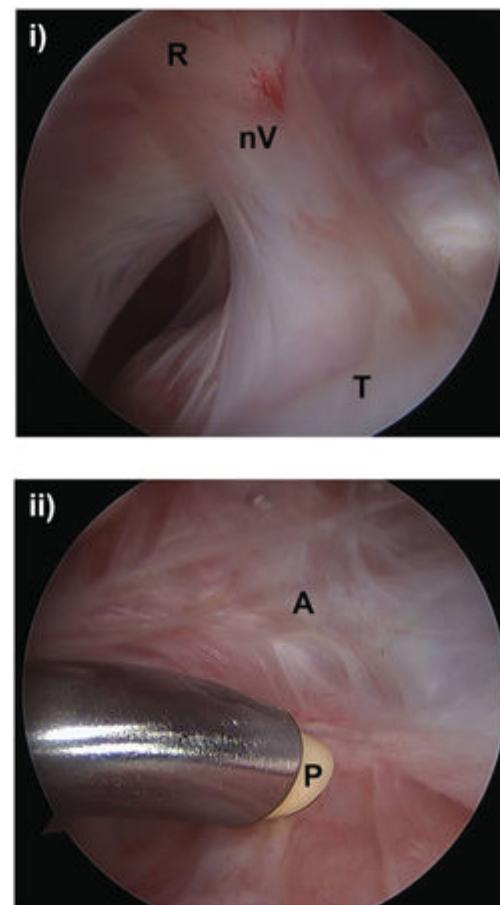

- Athrofibrosis is an 'induced' human pathology that can provide new mechanistic insights into fibrogenesis.

a)

b)

**Severe athrofibrosis**

R = suprapatellar pouch roof

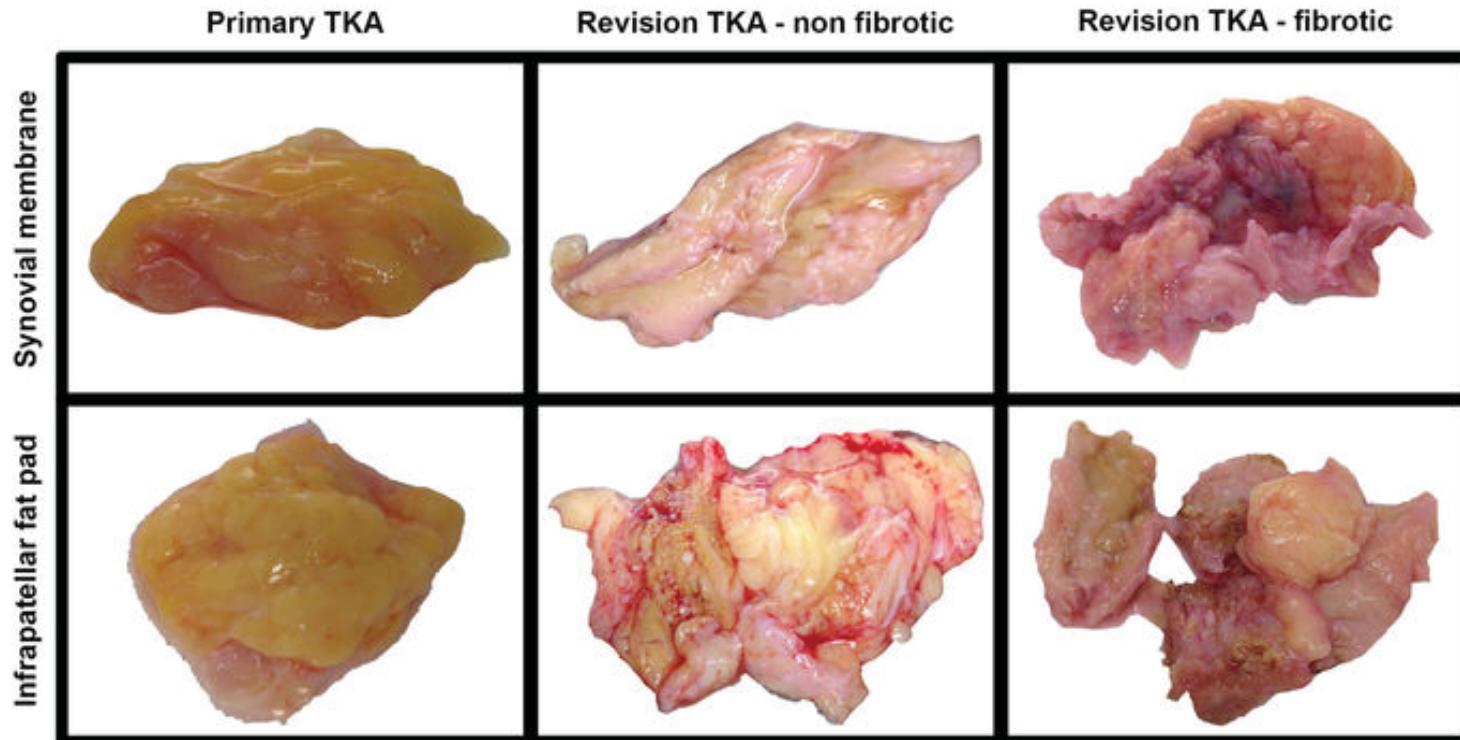

nV = neovascularisation

T Trochlea

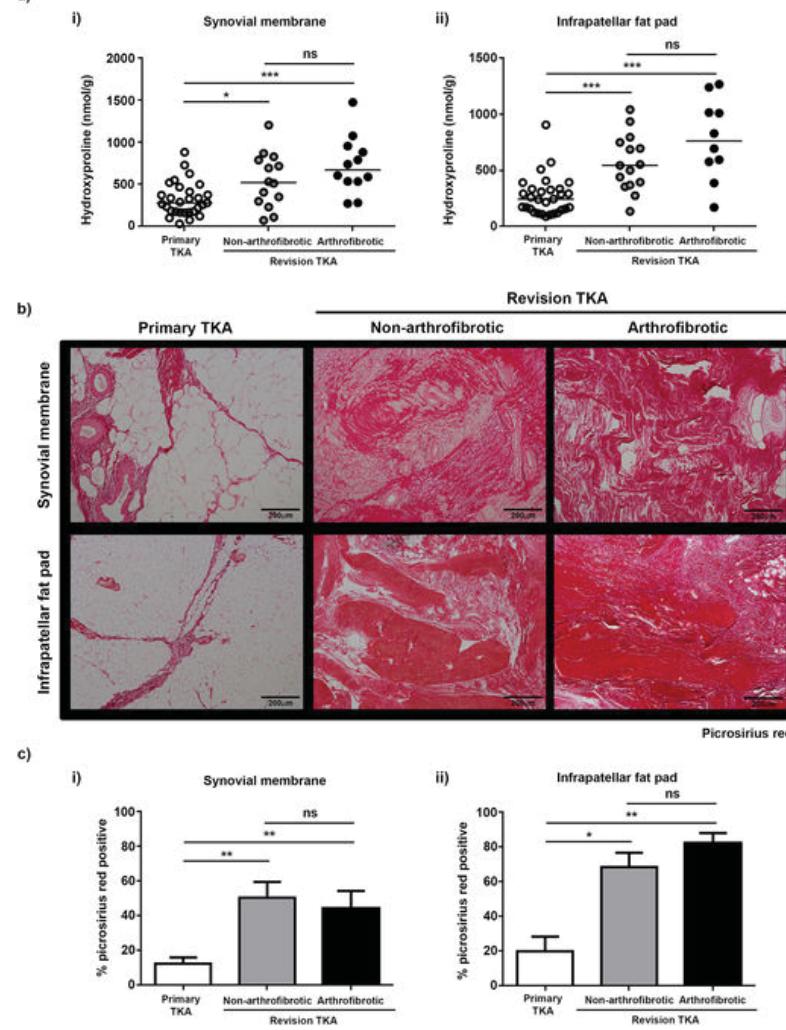

A = dense layered adhesions

P = probe

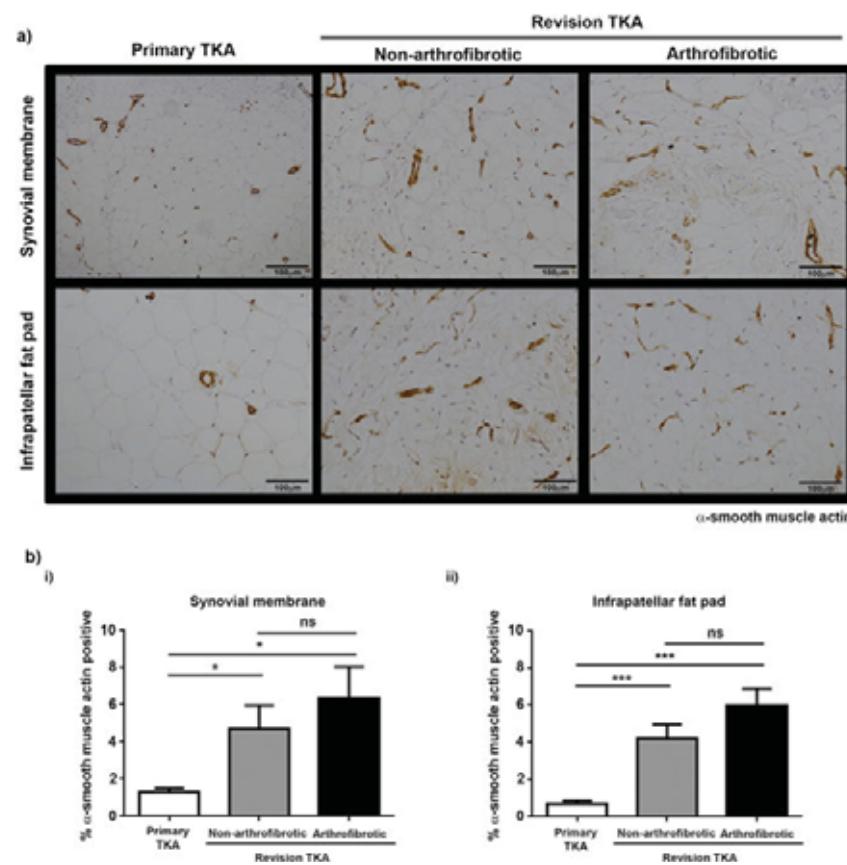

Macroscopic Images of post-TKA Fibrotic Joint Structures

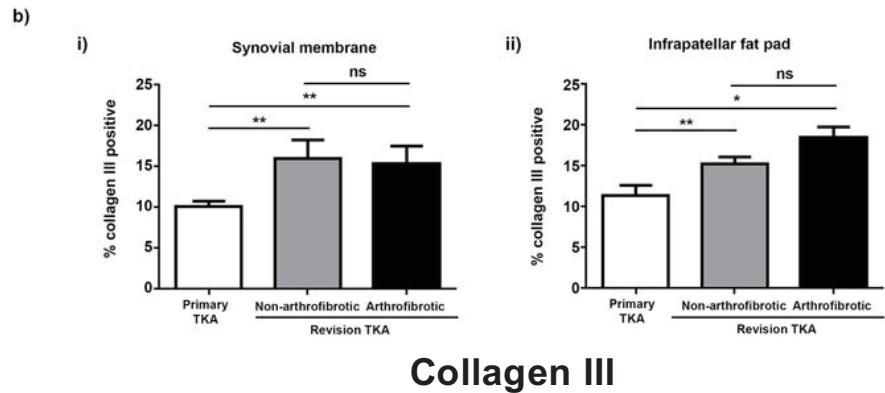

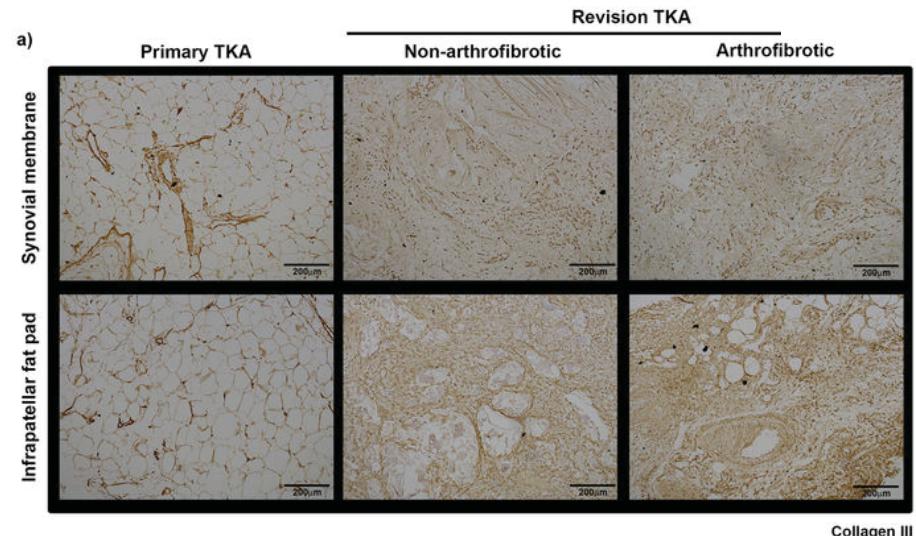

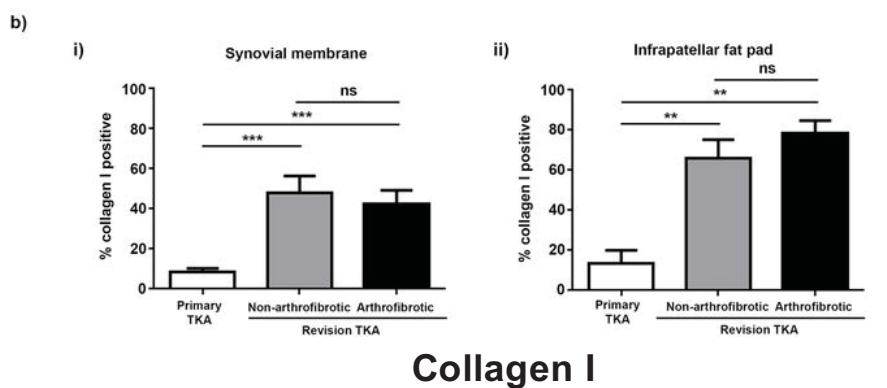

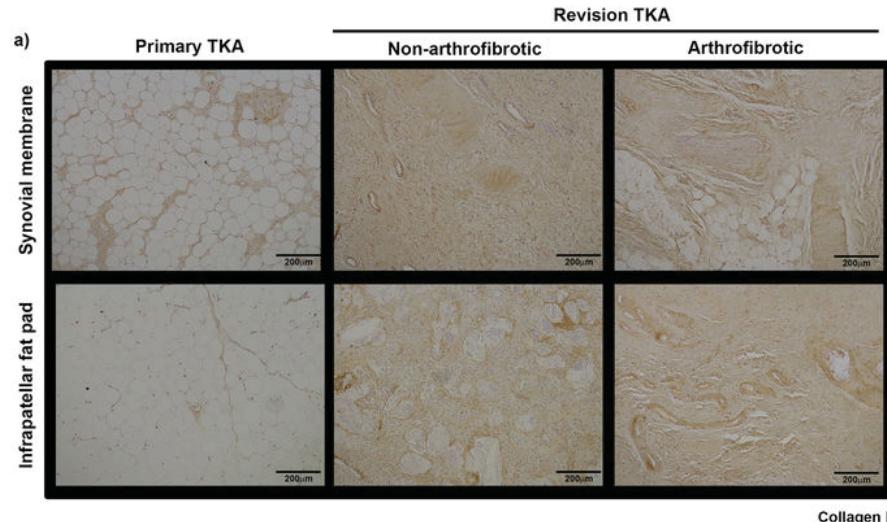

Fibrosis is a feature of the majority post-TKA joints

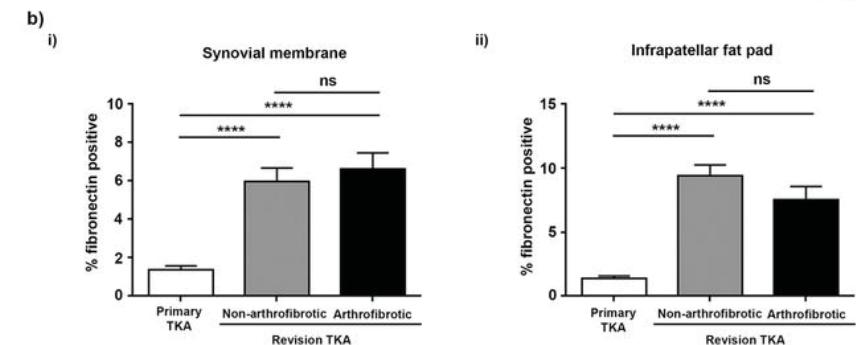

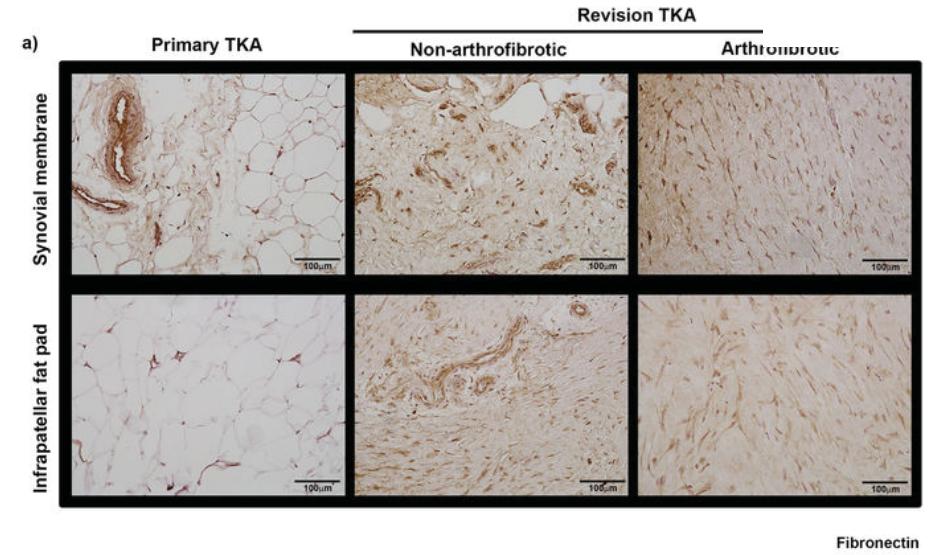

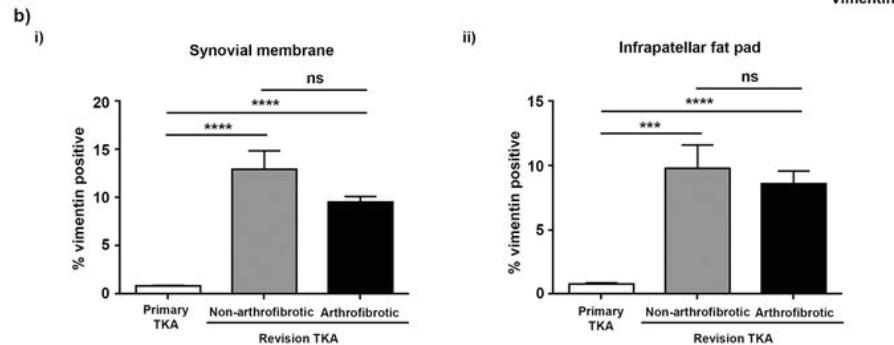

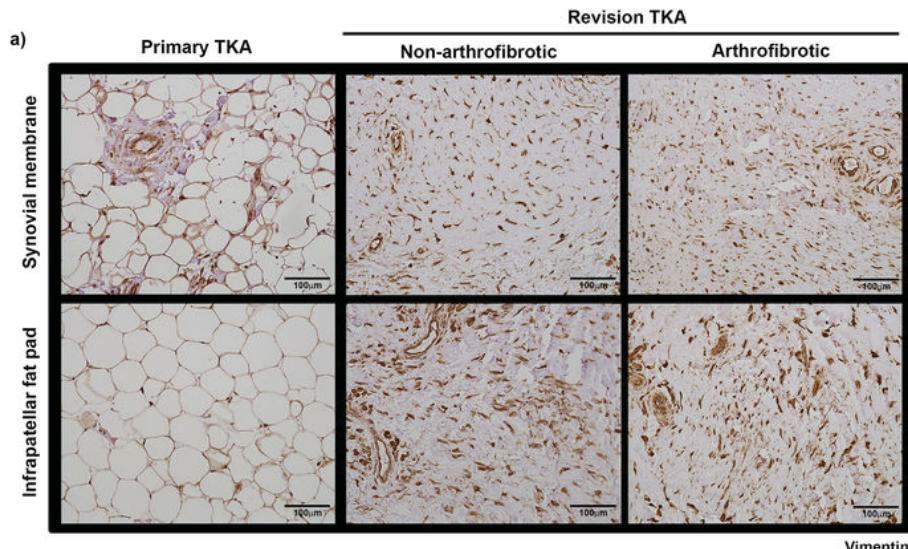

Collagen and Myofibroblast Accumulation

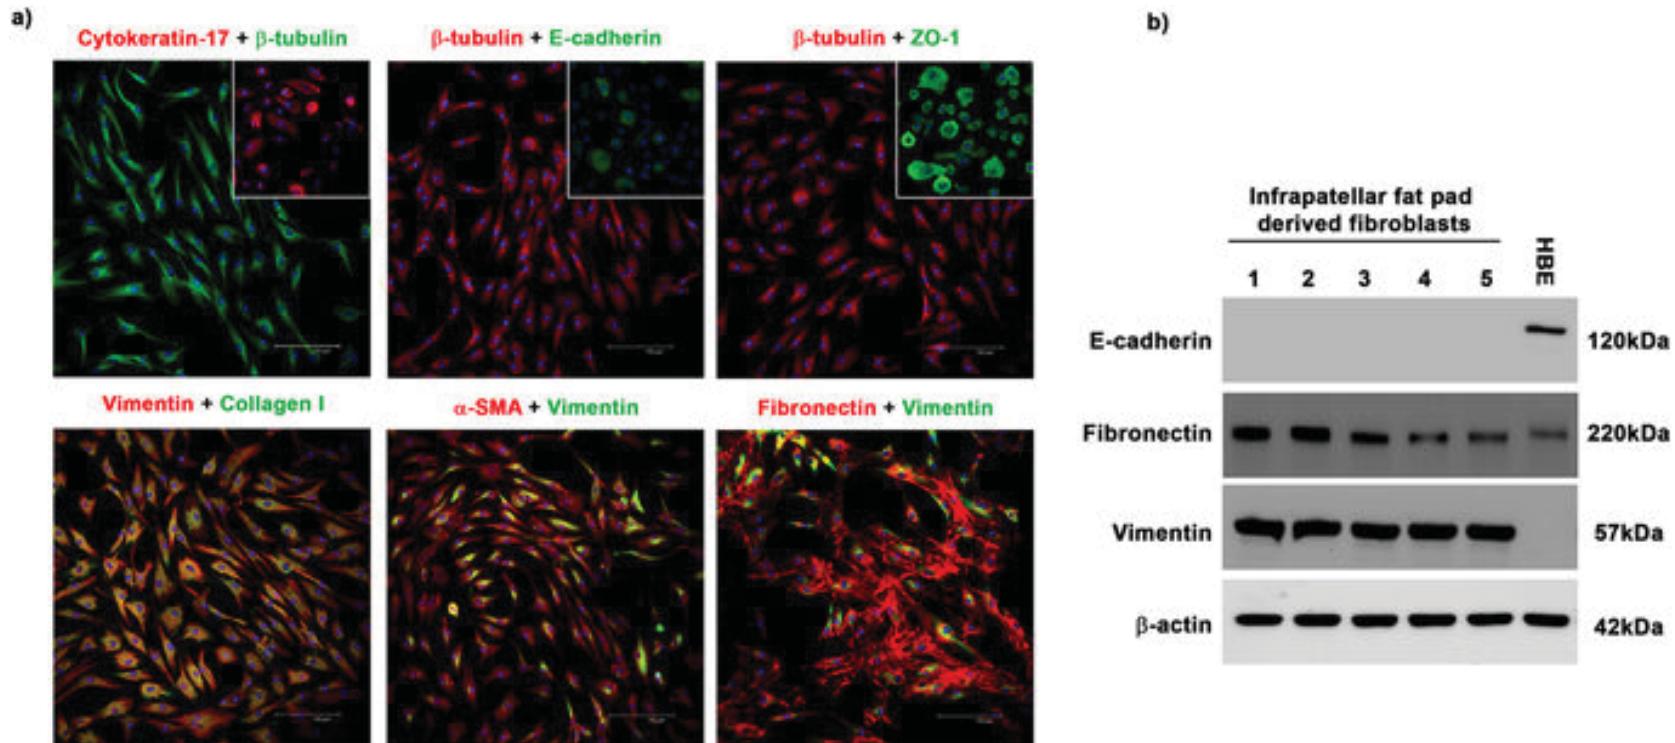

Accumulation of fibrillar collagens in post-TKA joint

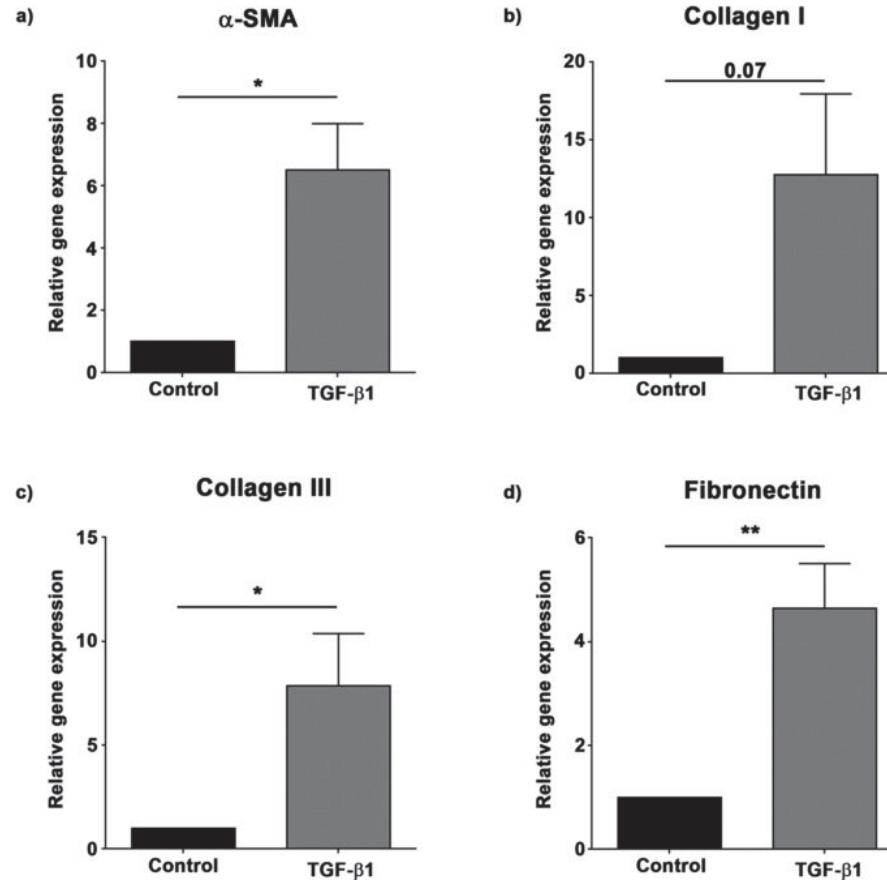

Accumulation of fibroblastic markers in post-TKA joint

Fat pad-derived fibroblasts are responsive to TGF β 1

Summary 1

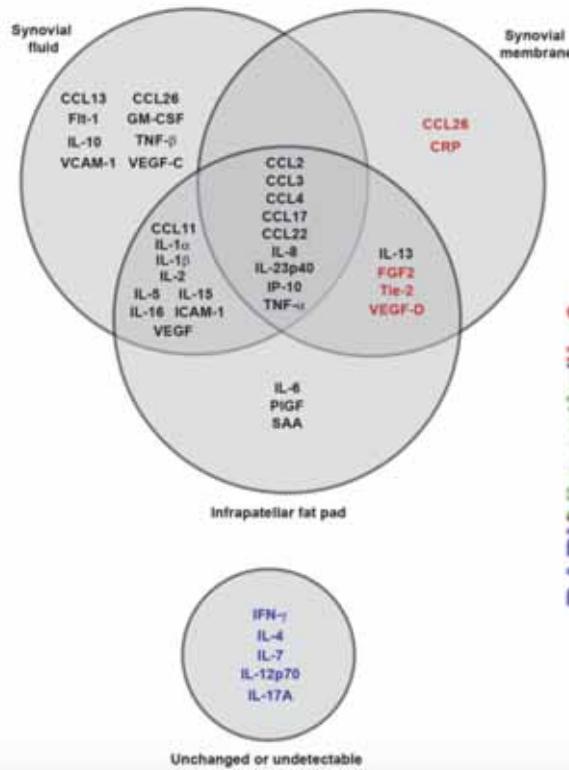

- Despite its success TKA can be associated with pain, swelling, stiffness and poor motion/mobility.
- Gross and histological analysis reveals fibrosis in all post-TKA joints.
- The post-TKA synovial membrane and fat pad exhibit dramatic collagen deposition and become populated with activated myofibroblasts.
- Fibroblasts isolated from the TKA fat pad are responsive to the main fibrogenic mediator TGFb1.

Is the post-TKA joint in a state of chronic inflammation?

Study of inflammatory mediators in primary ($n = 29$) vs revision TKA ($n=33$)

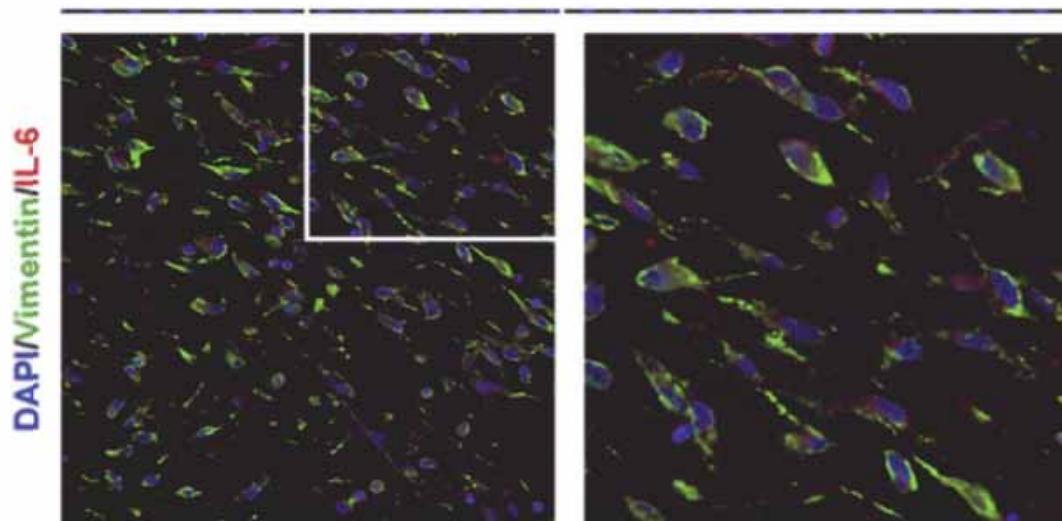

B

Primary versus revision TKA

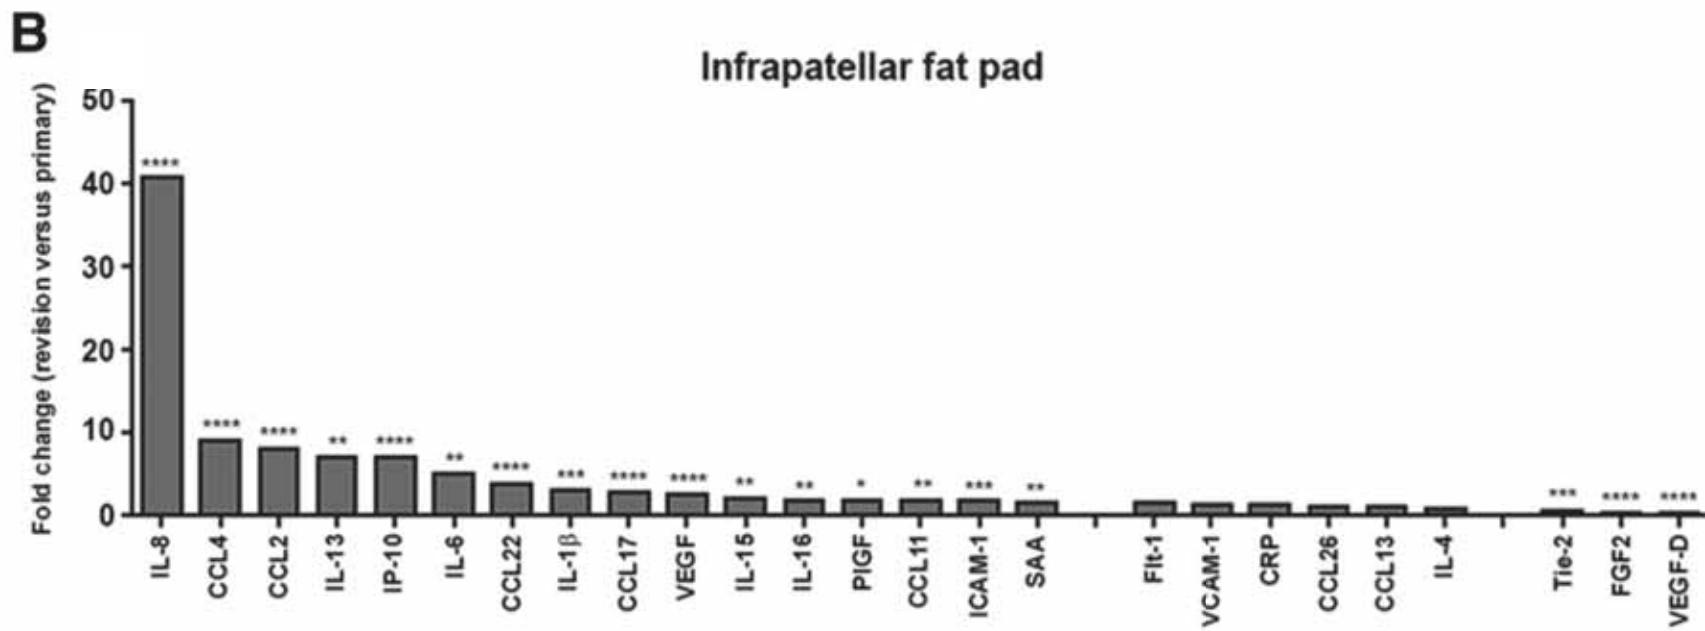

Aseptic inflammation is evident post-TKA and maps to fibroblasts

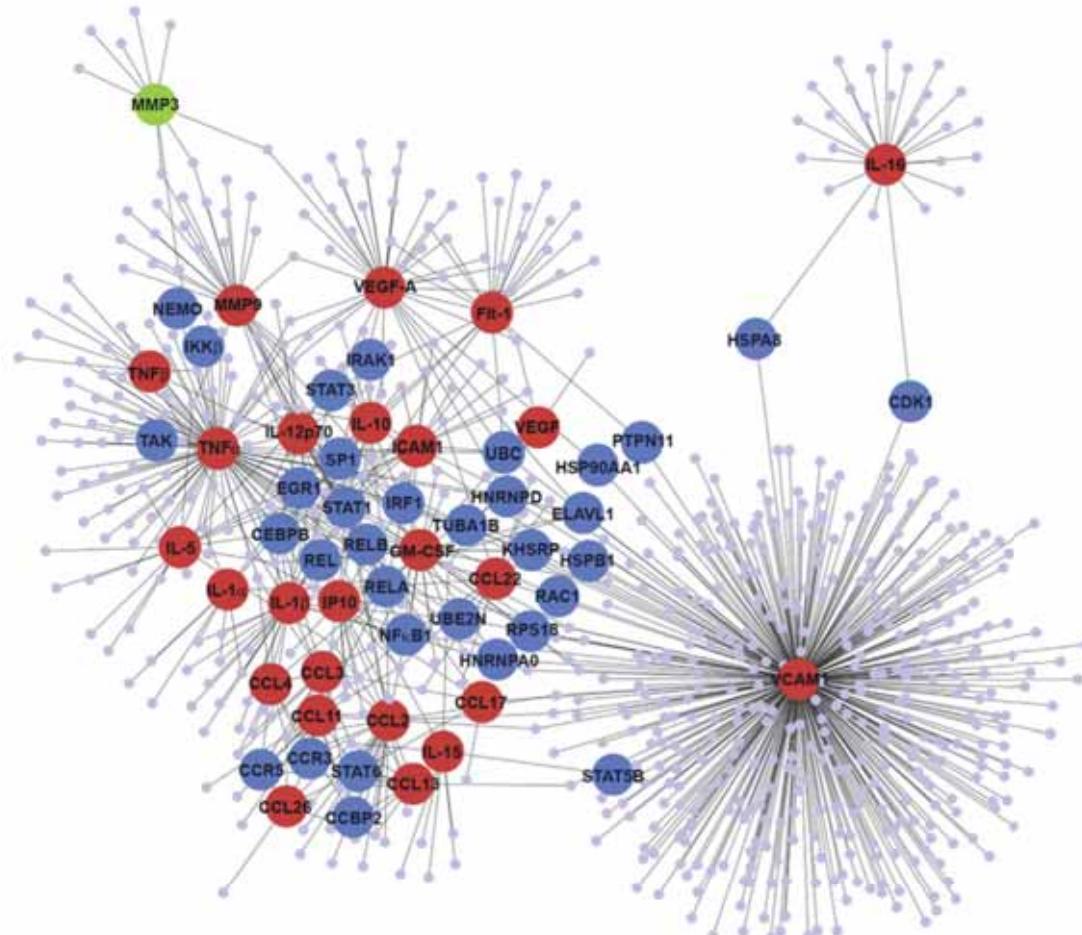

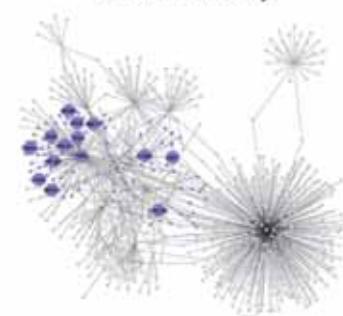

Revision TKA - infrapatellar fat pad

Paish H et al, A J Path 2018 (in press)

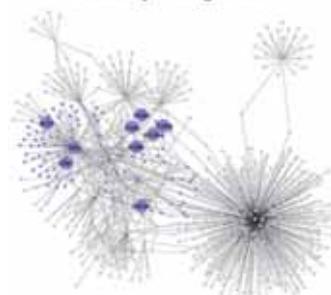

TKA fat pad protein-protein interaction network

NF- κ B TF activity

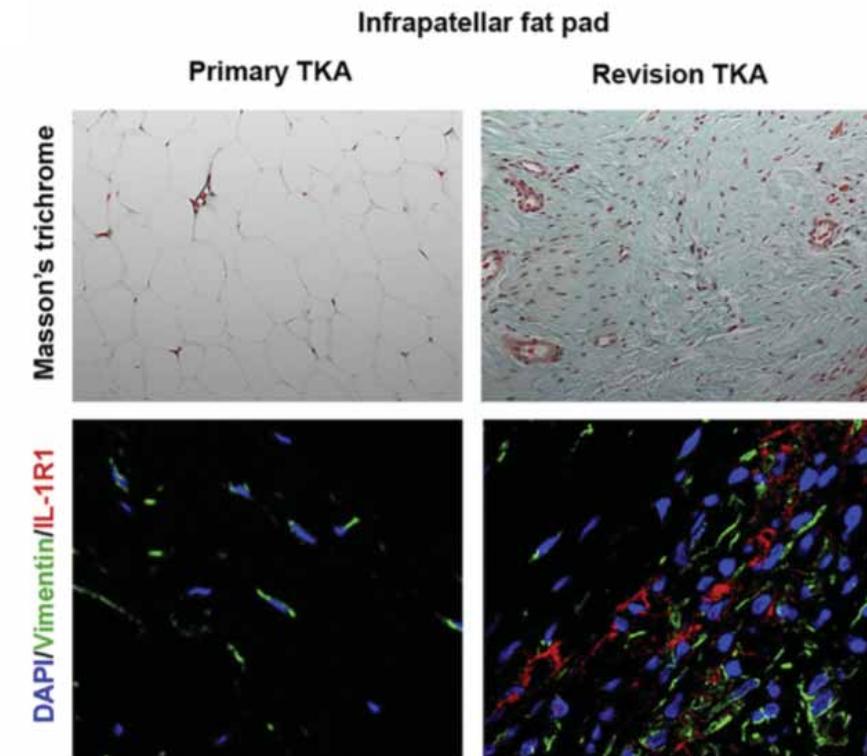

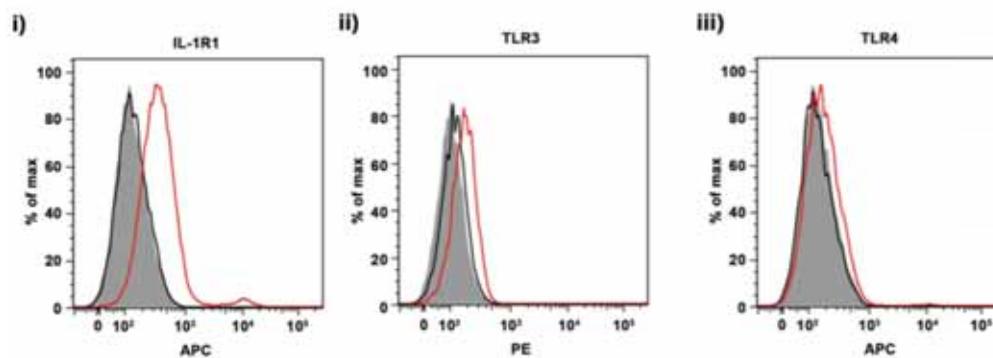

Response to wound healing

Leukocyte migration

Fat pad fibroblasts express surface IL-1R1, TL3 and TLR4

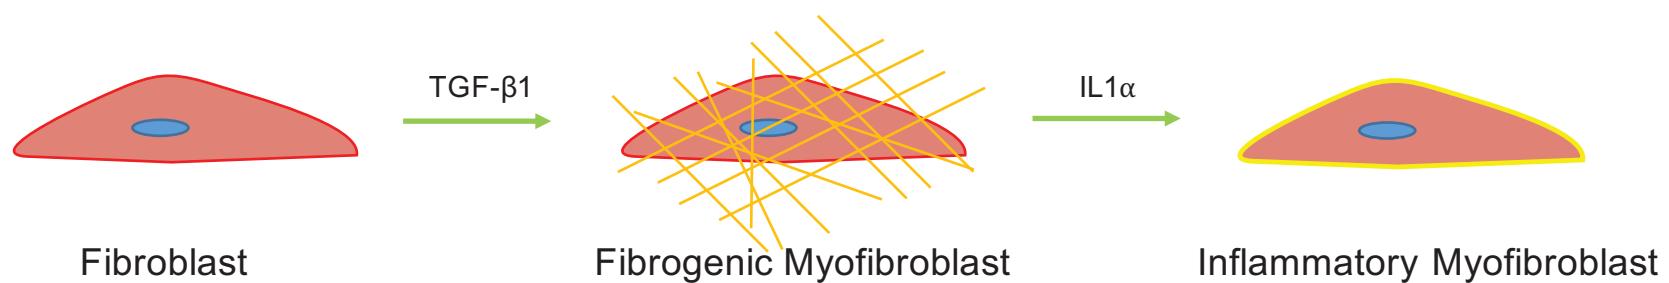

IL-1 α released from damaged epithelial cells is sufficient and essential to trigger inflammatory responses in human lung fibroblasts

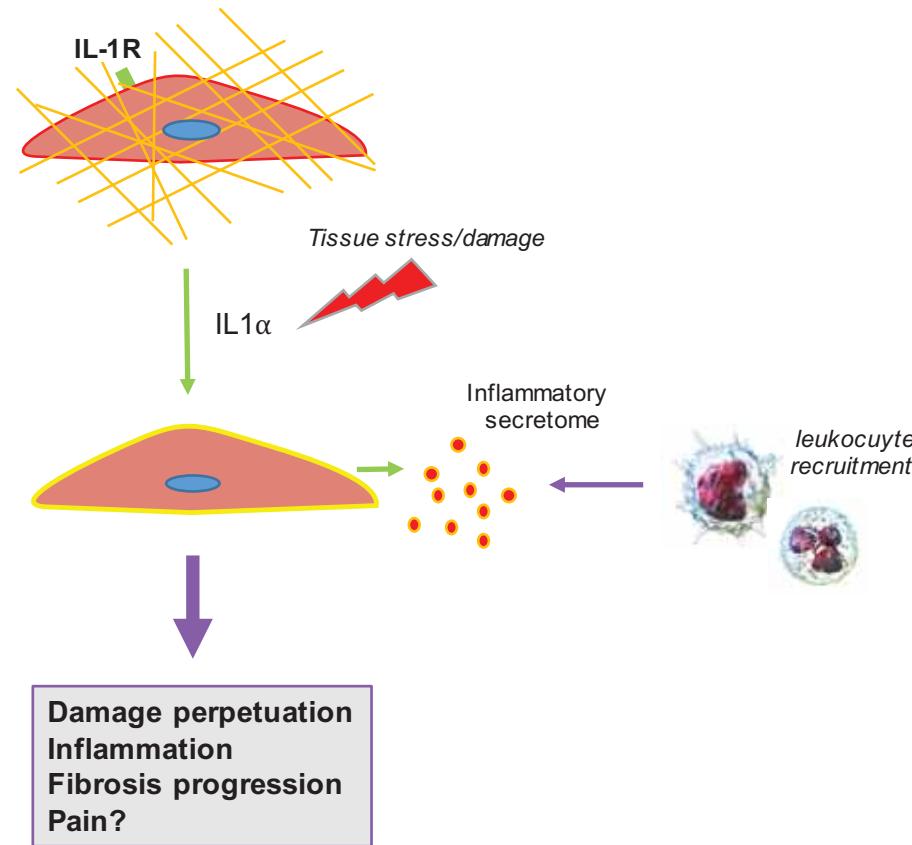

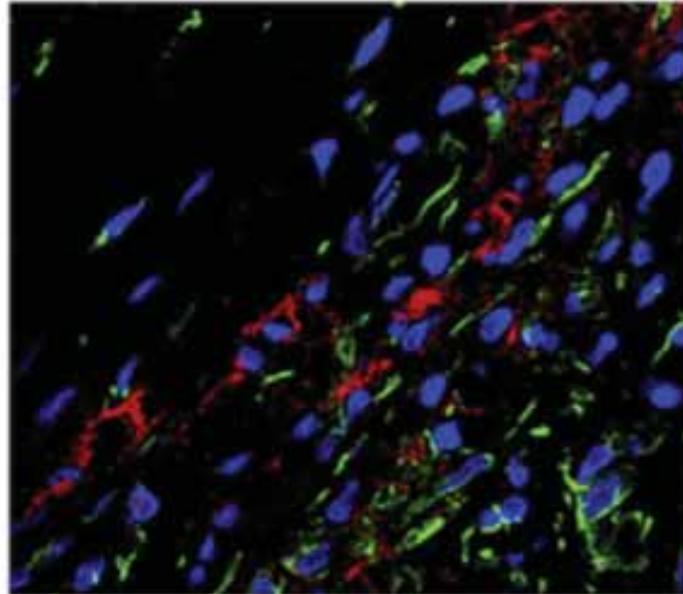

MI Suwara¹, NJ Green¹, LA Borthwick¹, J Mann¹, KD Mayer-Barber², L Barron², PA Corris¹, SN Farrow³, TA Wynn², AJ Fisher¹ and DA Mann¹

Mucosal Immunology | VOLUME 7 NUMBER 3 | MAY 2014

Fibroblast Heterogeneity and Polarization

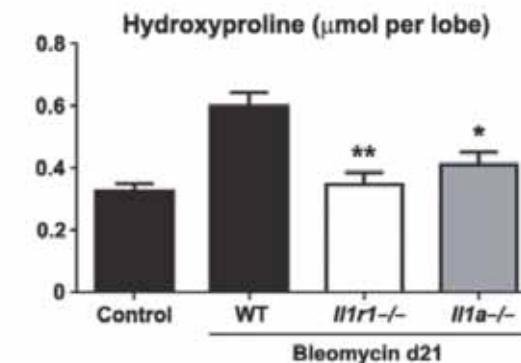

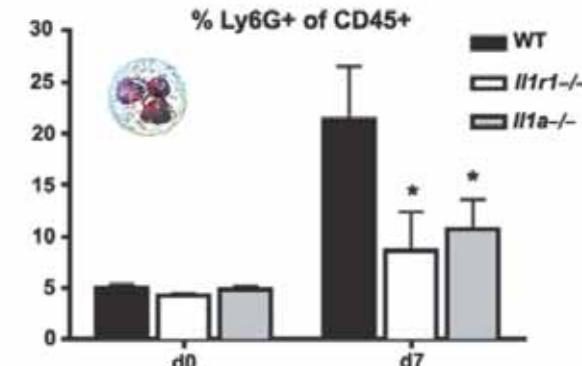

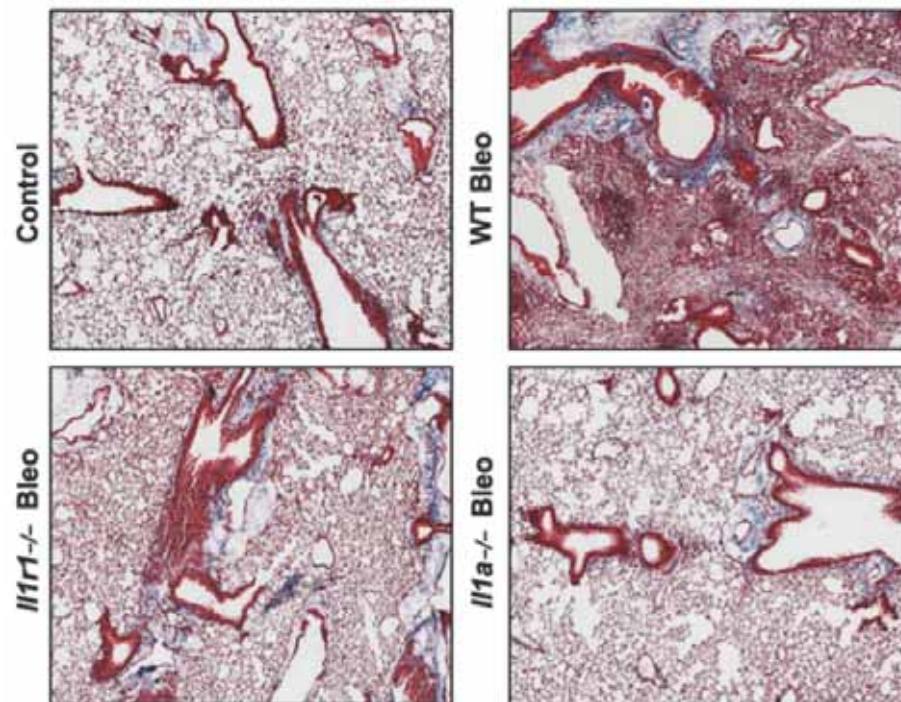

IL-1R-expressing fibroblasts and inflammatory priming

IL-1 α /IL-1R signaling required for lung inflammation and fibrosis

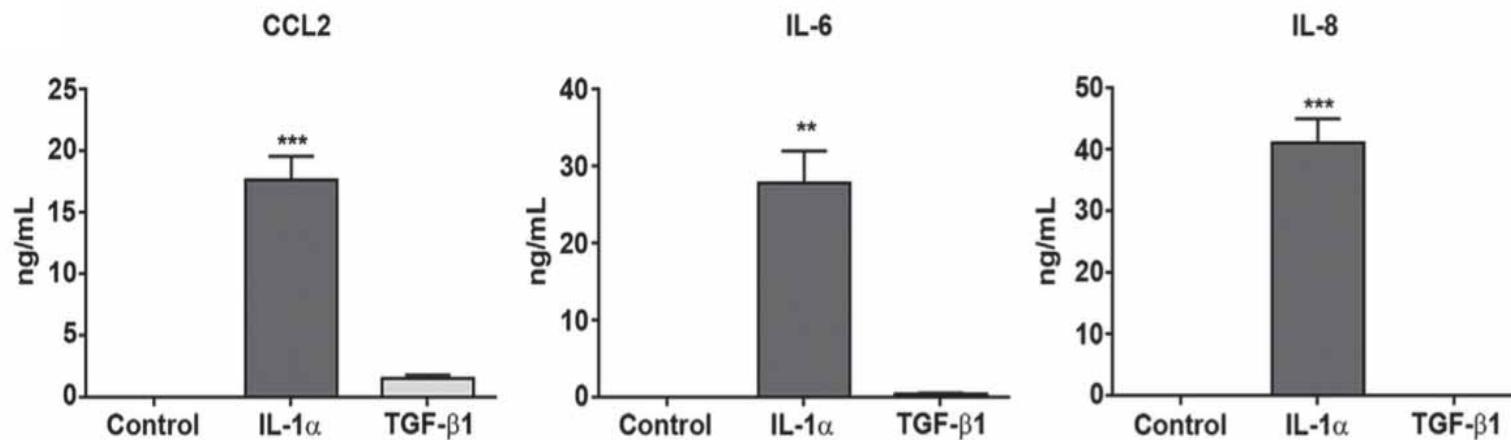

IL-1 α released from damaged epithelial cells is sufficient and essential to trigger inflammatory responses in human lung fibroblasts

MJ Sowery¹, NJ Green¹, LA Bothwick¹, J Mann², KD Mayer-Barber², L Barnes³, PA Corris³, SN Farrow³, TA Wynn², AJ Fisher³ and DA Menz¹

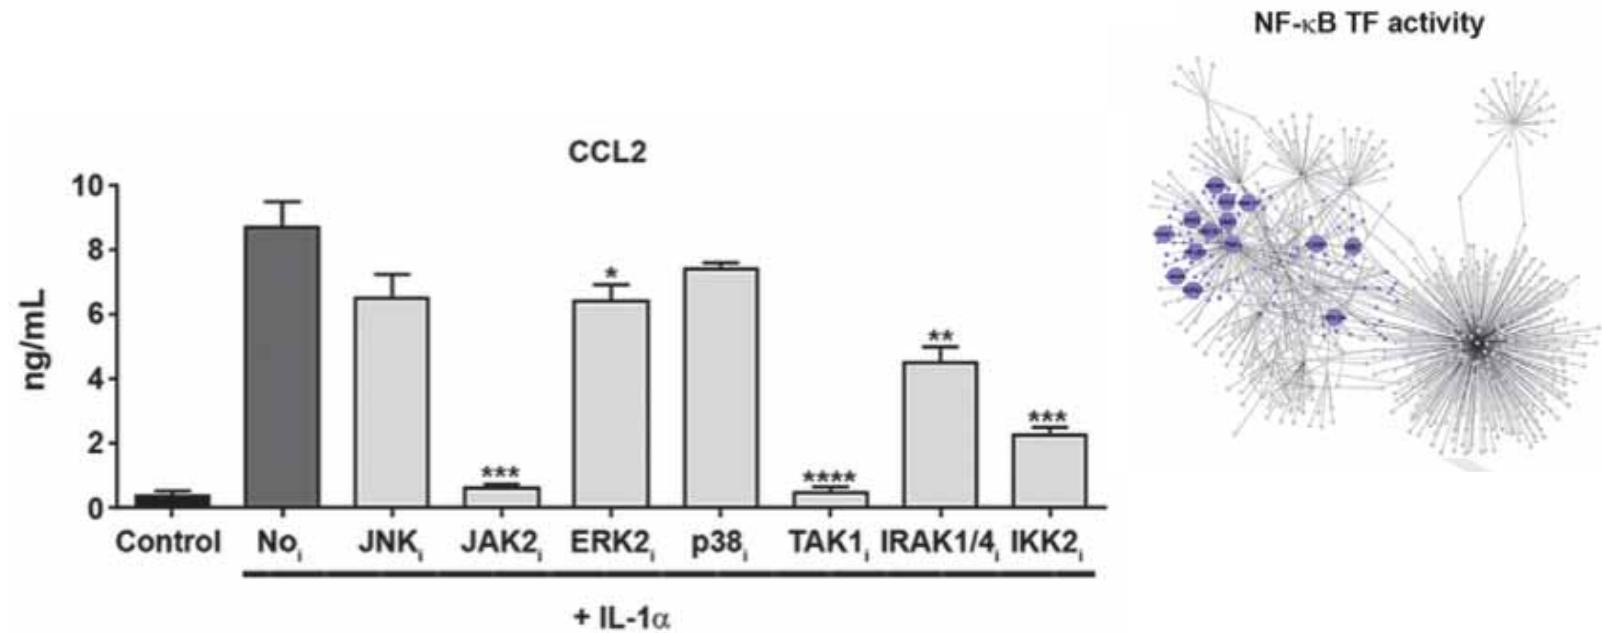

Coming next: $\text{II-1R1}^{\Delta\text{Fib}}$

IL-1 α (but not TGF- β 1) induces inflammatory polarization of human infrapatellar fat pad fibroblasts

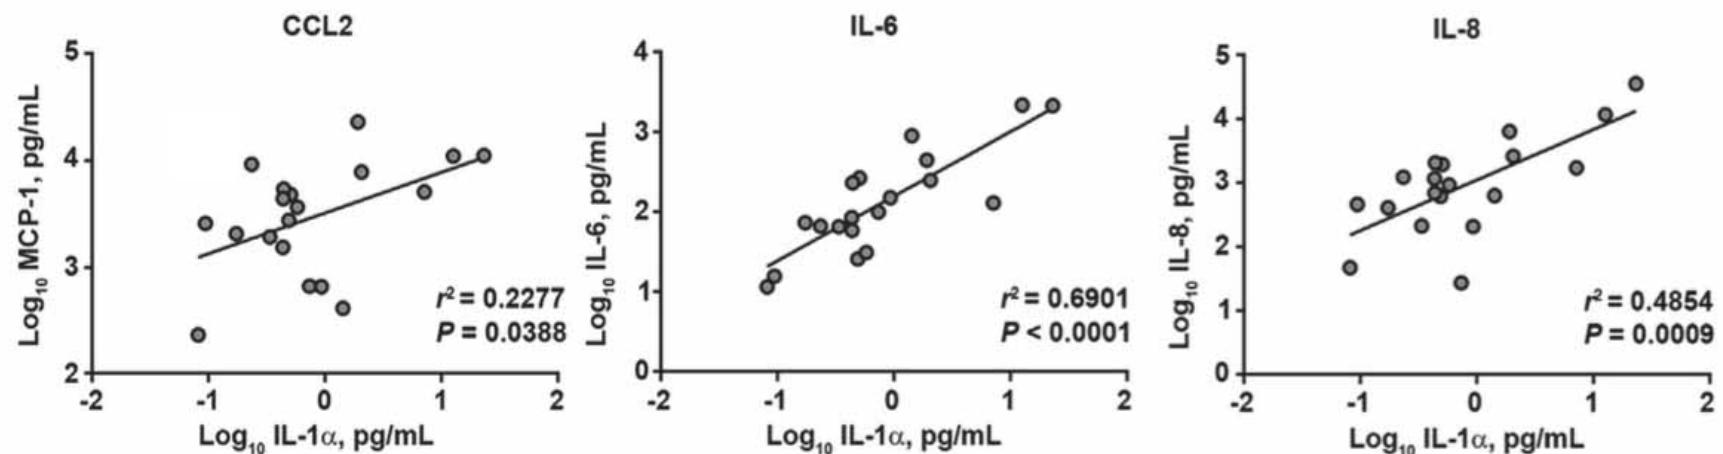

IL-1 α -induced polarization requires NF- κ B signaling

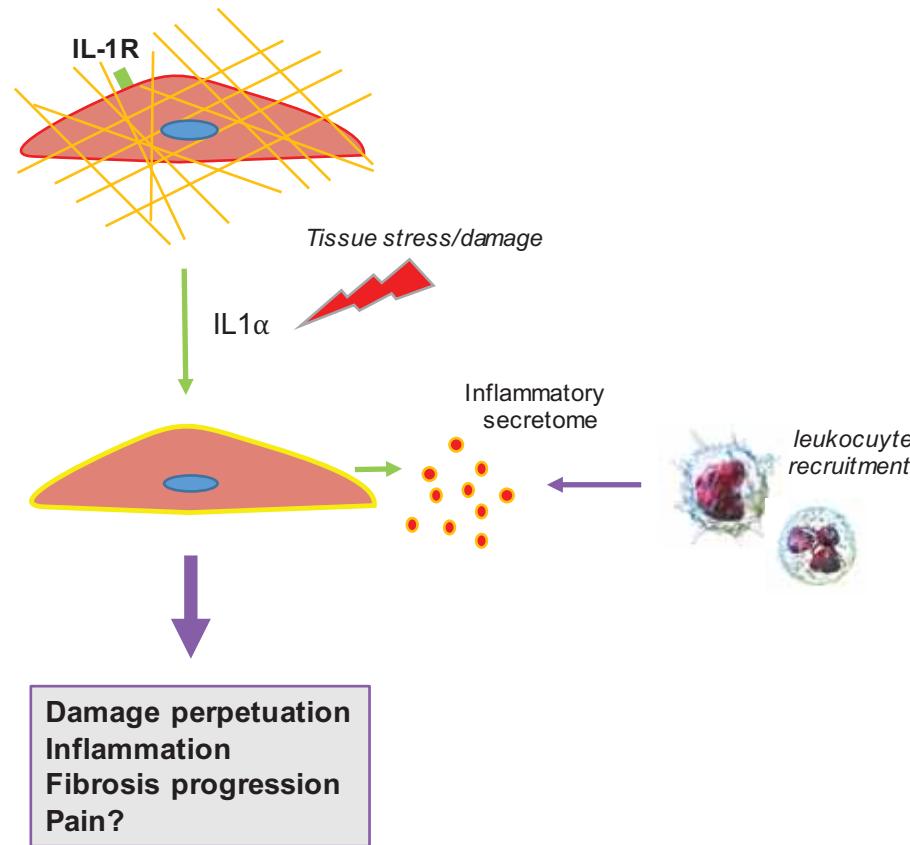

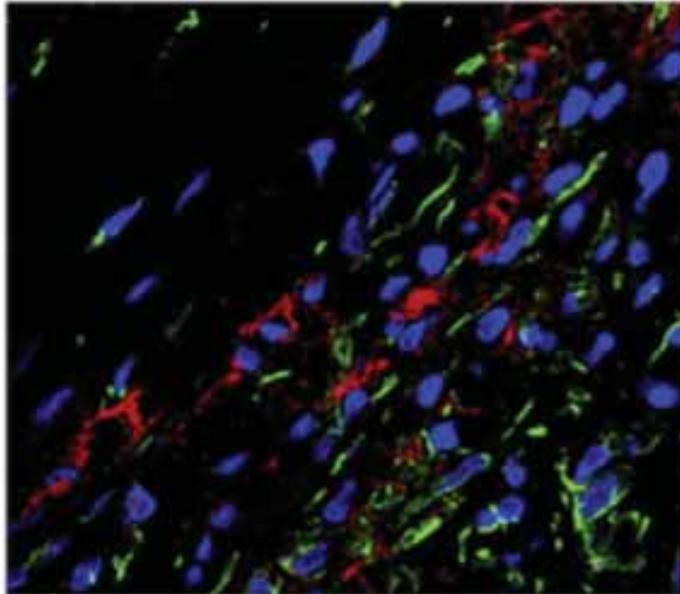

IL-1 α expression in TKA joint correlates with increased CCL2, IL-6 and IL-8.

Linear regression analysis on individual patient samples

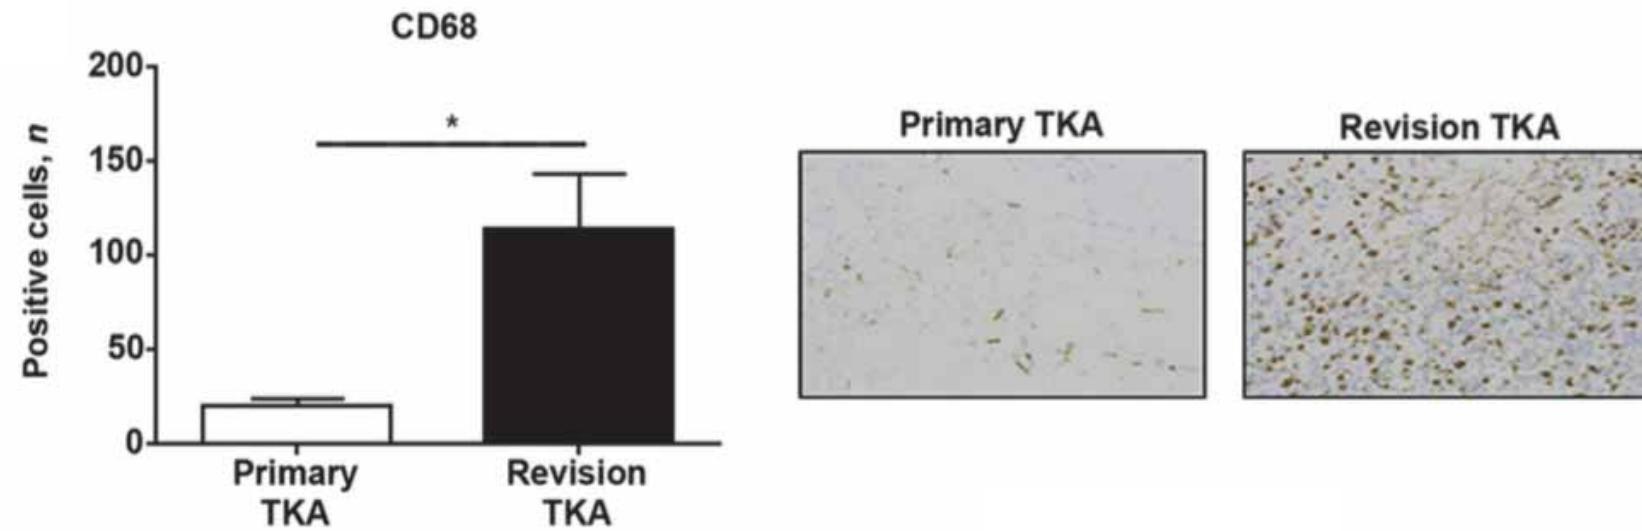

Synovial fluid

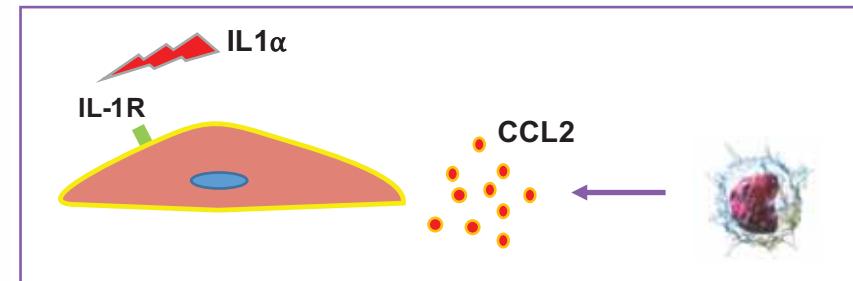

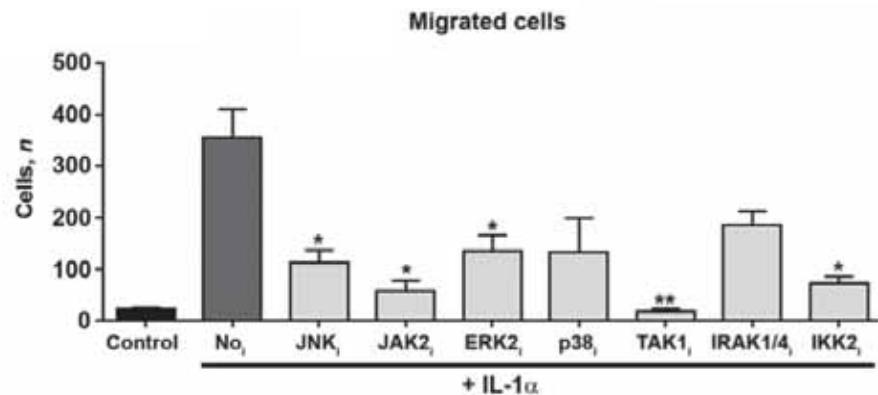

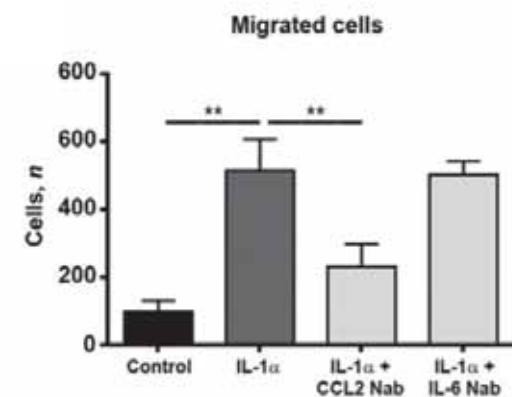

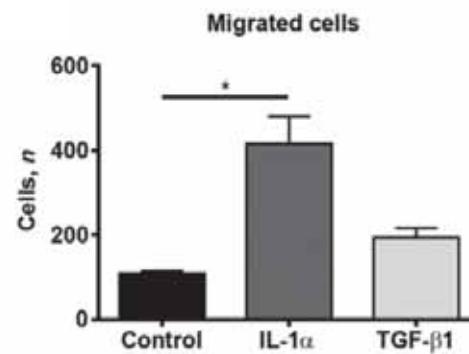

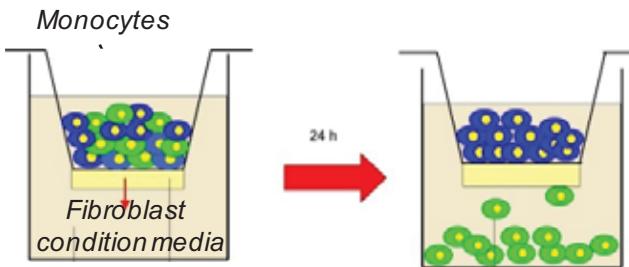

IL-1R-expressing fibroblasts and inflammatory priming

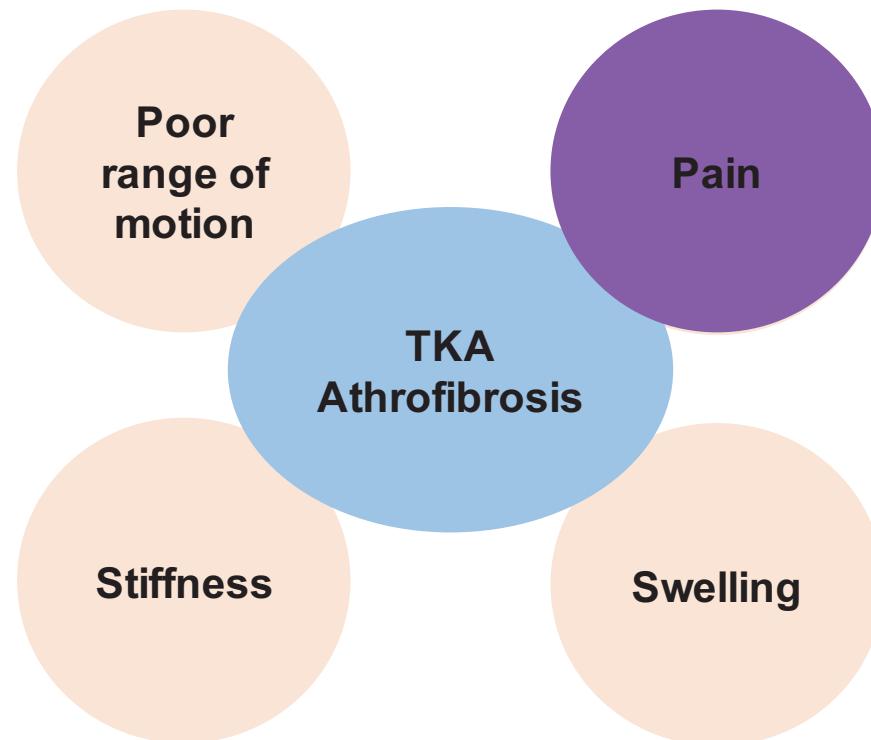

Monocyte numbers are increased in TKA revision fat pad

IL-1 α induces monocyte recruitment via NF- κ B dependent CCL2 secretion by IL-1R1 expressing fat pad fibroblasts

Translational Opportunities?

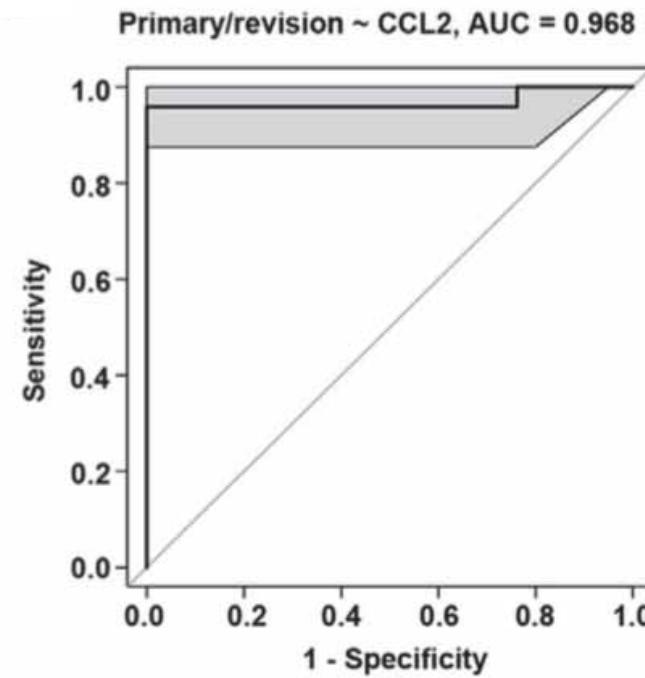

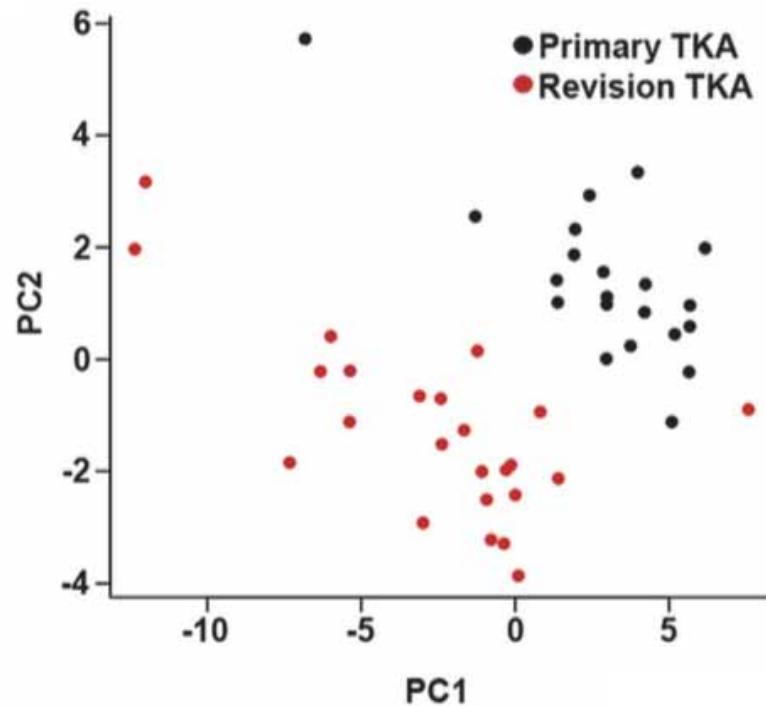

IL-1R antagonists (Anakinra)

CCR2 antagonists (AZ, GSK etc)

CCL2 inhibitors (Bindarit)

Post-TKA chronic pain correlates with synovial CCL2

Paish H et al, A J Path 2018 (in press)

Summary 2

- Replacement knee joints requiring revision display a characteristically chronic inflammatory profile.
- Fibroblasts in the fibrotic TKA joint display an inflammatory phenotype that is 'primed' by IL-1 α .
- TKA fibroblasts recruit innate immune cells through IL-1 α /IL-1R/NF- κ B/CCL2 intercellular cross-talk.
- Levels of the monocyte chemoattractant CCL2 in the TKA joint correlate with patient-reported pain .
- IL1 α , IL-1R, CCL2 and CCR2 antagonists have potential for therapeutic use in TKA.
