Background to the ASA-A

The Anxiety Scale for Autism – Adults (ASA-A©) is a 20 item self-report measure designed to measure anxiety in autistic adults. It consists of a general anxiety factor and three group factors: Social Anxiety (SP), Anxious Arousal (AA) and Uncertainty (U).

The ASA-A© can be summed to provide a total anxiety score, as well as broken down into group factor scores (the sum of items within a group factor). All items are rated on a 4-point Likert-scale, from 0 (“never”) to 3 (“always”).

The ASA-A© was adapted from the ASC-ASD© (Anxiety Scale for Children Autism Spectrum Disorder) in collaboration with professionals and autistic adults, to make it suitable for use in an adult population.

Terms of Use

The ASA-A© is copyrighted by Newcastle University (2019). Except where otherwise stated these materials may not be altered, amended or converted without prior permission of Newcastle University. They are available for download and use free of charge via https://research.ncl.ac.uk/neurodisability/. Use of the measure implies that the user has read and agreed to the terms of use. The measure is available for educational purposes, and professional use is the responsibility of the user, at the user’s own risk. The authors and Newcastle University are not responsible for any third party use of these instrument by individuals who have not read this guide and its terms of use. The measure may be used for research purposes, but as a professional courtesy, please notify Professor Jacqui Rodgers (Jacqui.rodgers@ncl.ac.uk) by email before undertaking your study.

We welcome translation of the measures and would request that you inform us of your intentions and that we are provided with a copy of the back translation for checking prior to use/publication. We also request that we are provided with a copy of the final translated instrument for non-commercial distribution via https://research.ncl.ac.uk/neurodisability/. Any commercial use or resale of the ASA-A© or its current and future derivative works is strictly prohibited. The ASA-A© is intended to be free for any interested user.

Support

Because there is no charge for any of these instruments, all support is provided on a voluntary basis by the authors. For questions that cannot be answered in this user’s guide, please email jacqui.rodgers@ncl.ac.uk.
Scoring

The ASA-A© is scored by assigning each item with a numerical value from 0-3 where 0 = Never, 1 = Sometimes, 2 = Often, and 3 = Always. To find the total anxiety score, the numerical value for all items is totalled (maximum score = 60). To find the group factor score, the numerical values for each item within the relevant group factor should be totalled. The items that makeup each group factor are shown below. For example, to find the Social Anxiety (SP) total, add the numerical values for items 2, 4, 5, 10, 12, and 14. The highest score possible for this group factor is 18, and the lowest is 0.

Missing data for raw scores can be handled by prorating the remaining items within a factor. It is recommended that factors with more than 1 missing item are not scored. Likewise, the total anxiety score can have up to 3 missing items, but only if each factor has no more than 1 missing.

Interpretation

A total score of ≥ 28 on the ASA-A© may indicate the presence of significant levels of anxiety. At present, indicative cut-offs are not available for the group factors.

Preliminary analysis of the psychometric properties of the ASA indicate excellent internal consistency (cronbach’s alpha total score .899, Uncertainty .834 Anxious Arousal .845 Social Anxiety .847), excellent one month test-retest reliability (.823) and robust convergent and divergent validity.

A full report of the psychometric properties of the scale can be found in:
